

A Wall for Every Project:

At storeWALL we offer three uniquely different grades of wall panel. A wall for every project and every budget. A few notes about each are provided below so that you can make the best choice for the project that matters most – your project.

Heavy Duty: This is our elite wall panel so it is loaded with high end and high performing features. It is considerably larger than all other wall panels (15" high) and also thicker. It is produced with a high-density industrial grade PVC which allows for crisp edges on the slat (not rounded) It is compatible with our hidden fastener installation system (Installstrips) so it provides for a more attractive and easier installation. And the Installstrip is the source of incredible holding capacity of 300lbs per square foot at the surface (be sure and see our video demonstration). If you want the best slatwall system the world has ever seen storeWALL Heavy Duty is the choice for you.

Standard Duty: This is the second best slatwall system on the market and provides many of the high end and high performing features as our found in our Heavy Duty such as high-density industrial grade PVC and they can make use of our installstrip installation system (270 lbs of holding capacity at the surface). However, our Standard Duty wall is a little smaller (12" high) and a little thinner. Please see our Standard Duty wall video. If you are looking for good performance at a value price our Standard Duty wall is the choice for you.

Basic Duty: This wall panel is by definition very basic and made to be the same as other regular slat wall panels found in the market. It is 12" high, has rounded slats, and can only be installed by screws through the face of the panel into the stud. It's holding capacity is limited to 75lbs per square foot at the surface. The primary advantage of our Basic Duty is its low price. Please see our Basic Duty wall video.

A Few More Important Notes:

Moisture: PVC slatwall panels are impervious to moisture. This makes them ideal for uncontrolled climates such as the garage. PVC panels will last almost forever and are a much better choice than MDF slatwall and pegboard which is quick to rot and typically only lasts a season or two.

Force: Force and PVC slatwall are a bad combination. As explained, our PVC is incredibly strong, but this is not to suggest it is unbreakable. Think of a hammer. Certainly, our wall panels can support the weight of any hammer. However, if you use the hammer to strike the wall panel with enough force the hammer is going to win every time. So be careful not to create unwanted force by "plopping" a heavy item on a hook, shelf, or basket. Also be wary hooks, shelves, and baskets manufactured by other

companies that can be of loose fitting. For this reason, we do not warranty our wall panels when other manufactures' accessories are used.

Streaking: Roller markings and streaking are inherent to extrusion manufacturing. These are typically imperceptible in lighter colors but can be more noticeable in darker colors when refracting light and viewed from a side angle (normally when hung on the wall they are not visible from a frontal view). So as to eliminate any unwanted streaking we have taken an additional step and added a surface treatment to the darker colors in our Heavy Duty and Standard Duty wall to include Weathered Grey, Graphite Steel, and Bronze. Please note our Basic Duty wall does not include this surface treatment.

Color Matching: Extruded PVC is a bit like mixing paint in that that can be some variation in color from batch to batch. We control this with a spectrometer and tight tolerances but even so, different batches can refract light differently and thus appear to have slight variation in shading. To best prevent this, we discourage mixing panels from different batches on the same wall. For this reason, all of our wall panels have the batch date marked on both the carton and the backside of the panel.

Graphite Steel and Bronze finishes are a unique metallic surface treatment, very similar to that found on an automobile. The substructure is solid PVC as are all storeWALL slatwall panels. Please note the metallic effect is only on the surface and if gouged deep enough, just like an automobile, the gouge may show. Thus we encourage reasonable care and handling be exercised when choosing our **Graphite Steel or Bronze** slatwall panels.

Weathered Grey finishes are made as solid color slatwall but do have a painted finish on the surface. This is to eliminate common streaking in the extrusion process that is only found in grey extruded plastic. The painted finish results in a even consistent finish.

Rustic Cedar, Global Pine and Barnwood finishes are intended to simulate real wood; and like real wood there might be some variation in grain and tint from panel to panel.
